## Software Engineer

Backend | Full-Stack | Cloud | AI Systems

Software Engineer with experience building scalable full-stack applications, cloud infrastructure, and AI-powered systems using Java, Spring Boot, Node.js, React, AWS, and Kubernetes across startup and enterprise environments

## Technical Skills

|                              |                                                                               |
|------------------------------|-------------------------------------------------------------------------------|
| <b>Languages:</b>            | Java, JavaScript/TypeScript, Python, C#, SQL, HTML/CSS                        |
| <b>Frontend:</b>             | React.js, Next.js, Angular, Vite, Tailwind CSS                                |
| <b>Backend:</b>              | Node.js, Express.js, Spring Boot, Spring Cloud Gateway, FastAPI               |
| <b>AI/ML &amp; LLMs:</b>     | DeepSeek APIs, transformer embeddings, semantic search, vector based matching |
| <b>Data &amp; Messaging:</b> | PostgreSQL, MySQL, MongoDB, Redis, Kafka, WebSockets, Server-Sent Events      |
| <b>CI/CD:</b>                | GitHub Actions, GitLab CI, Jenkins, Prometheus, Grafana                       |
| <b>Testing &amp; Tools:</b>  | Jest, Jasmine, Selenium, JMeter, Git, Jira, Postman, Chrome DevTools          |

## Professional Experience

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |                     |

## Projects

---

### **Multimedia Review Platform** | Node.js, Express.js, Angular, MongoDB, Socket.io

- Built a full-stack multimedia review platform using Node.js, Express.js, Angular, MongoDB, and the TMDb API, implementing genre filtering with multi-tag AND/OR search logic and RESTful API integrations
- Developed secure JWT authentication workflows with refresh token rotation, protected CRUD operations, middleware request validation, and Mongoose schema validation for user and review management
- Optimized backend performance with MongoDB compound/text indexing and implemented real-time review updates and live user events using Socket.io WebSockets

### **Neuragate** | Java, Spring Boot, Kafka, Redis, Docker

- Built an AI-driven self-healing API gateway using Java 21, Spring Cloud Gateway, Kafka telemetry pipelines, Redis-backed rate limiting, and Resilience4j circuit breakers
- Developed anomaly detection and AI-assisted remediation workflows with Prometheus metrics, SSE dashboards, and stress-testing infrastructure supporting 1000+ requests/minute.

### **EcoBrief** | FastAPI, AWS, Ray Serve, React

- Designed a scale-to-zero AI news summarization platform using Java ingestion services, FastAPI orchestration, AWS EC2 auto-provisioning, Ray Serve, and S3-backed pipelines to minimize cloud infrastructure costs
- Deployed a quantized Llama 3.2 3B model in a 2 GB RAM environment while generating MP3 summaries with AWS Polly and serving results through React and Tailwind frontend applications
